

The Living Education Curricular Series©
By Andrea Seidman

The Living Education Curriculum focuses on developing skills through a rich content-based program.

Optimal understanding and retention is maximized when the material taught is relevant and meaningful to the student's life. Integrating the basics of language arts, math, science, social studies and the arts in a thematic approach puts information into context.

The context is determined according to the interests of the team of students in the class.

The teacher is a facilitator in the process and an integral participant in the class community of learners.

This curriculum is a disciplined structure aiding teachers in turning their classroom into differentiated learning experiences for every child.

The curriculum progresses from the beginning of the academic school year to the end with each learning unit and theme building on knowledge from prior sections.

It allows for individual expression, creativity as a team member, and always has a different outcome depending upon the personality of the class.

Living Education is building confidence by encouraging the student to contribute according to his/her strengths and strengthening weaknesses from each other's support.

Living Education is bringing life into the classroom in a way that is educational, intellectually stimulating and custom designed for every unique learner.

Every educator; teachers and administrators of all age levels may use this series to create a brain-friendly environment differentiating to the individual student's learning strengths and ability.

Living Education is a cooperative educational environment where students and teachers are part of a community of learners.

Parents may want to understand the process and reinforce their child's learning by reinforcing exercises during teaching moments in the home. Teachers, students and parents become involved in the educational process. Parent involvement is a proven fundamental force for higher student achievement at every age level.

It is best to mind map your lesson plans according to the specific objectives and goals for each subject area or topic. This will ensure that you are including the content and activities relevant to the main topic. In addition, mind map plans help you visualize the activities through teaching to each of the learning modalities. Every person and student has learning style preferences. These preferences may be learning through

auditory, visual, and kinesthetic opportunities and are right and left brain-friendly. Reinforcing the concepts with a variety of learning style activities differentiates to each student's ability to understand and retain the information.

Mind-Map your lesson plans
